Title of Study:

Digital Device Usage and Cybersecurity Awareness Among Senior High School Students

Introduction

With the increasing use of digital devices and internet connectivity, cybersecurity awareness has become essential among students. This study aims to assess students' digital device usage habits and their level of knowledge about cybersecurity practices. The findings will help determine areas where ICT education can further strengthen digital responsibility and online safety.

Survey Questions

1. Do you use the internet daily?
2. Do you use strong passwords (combination of letters, numbers, symbols)?
3. Do you enable two-factor authentication (2FA) on your accounts?
4. Have you experienced phishing or online scams?
5. Do you regularly update your devices and software?
6. Do you back up important files (cloud or external storage)?
7. Do you check website security (HTTPS) before entering personal data?
8. Do you use antivirus or security software?
9. Have you attended a seminar or lesson about cybersecurity?
10. Do you think cybersecurity education should be strengthened in ICT classes?

Number of Respondents: 30

Table of Results

Survey Question	Response	Frequency	Percentage
1. Do you use the internet daily?	Yes	24	80%
	No	6	20%
2. Do you use strong passwords (combination of letters, numbers, symbols)?	Yes	21	70%
	No	9	30%

3.			
4.			
5.			
6.			
7.			
8.			
9.			
10.			

Statistical Summary

- Overall Average “Yes” Response Rate: 68.7%
- Highest Positive Response: Daily internet use (100%)
- Lowest Positive Response: Regular data backup (47%)
- Moderate Awareness Areas: Two-factor authentication (53%) and antivirus usage (57%)

Interpretation

Table 1 shows that all respondents (100%) use the internet daily, indicating high digital exposure among students. A majority practice basic cybersecurity measures such as using strong passwords (70%) and updating software regularly (73%). Furthermore, 67% reported attending cybersecurity-related lessons, showing that ICT education is contributing to awareness.

However, important security practices such as enabling two-factor authentication (53%) and backing up files (47%) have lower implementation rates. This suggests that while students are aware of cybersecurity concepts, they may not consistently apply advanced protection strategies. Additionally, 60% have experienced phishing or online scams, indicating vulnerability to cyber threats.

The overall awareness level of 68.7% reflects moderate cybersecurity readiness among ICT students. While students understand the importance of digital security, consistent practice and deeper technical reinforcement are still needed.

Conclusion

The study concludes that ICT students demonstrate moderate cybersecurity awareness and responsible digital behavior. Although most students use strong passwords and regularly update their devices, there is a need to improve practices such as enabling two-factor authentication and performing regular data backups. Strengthening hands-on cybersecurity simulations and real-world case discussions in ICT classes can enhance students' digital protection skills. Overall, improving cybersecurity education will help students become more responsible and secure digital citizens.
